

Every great investment begins with *judgment.*

A walkthrough of how to research a company with
InvestIQ's AI investment committee, read the verdict it
hands back, and know what to trust in it.

What you're looking at

InvestIQ isn't a chatbot you argue with about stocks. You give it one company name, and it runs a whole research process on its own: six AI analysts split into roles, dig up evidence, argue the bull and bear case against each other, stress-test the risks, and land on a call. You watch the whole thing happen, then read the memo at the end.

This guide walks through a real run (SpaceX, screenshots below) end to end, then explains what everything on the final report actually means.

Fastest way to try it: open `invest-iq-lake.vercel.app` in a browser, type a company name into the search bar on the landing page, and click **Investigate**. No account, no setup. A run usually takes one to three minutes, since it's doing real research every time rather than replaying a canned demo.

Want to run it on your own machine instead?

Clone the repo, install dependencies, copy `.env.example` to `.env.local` and drop in at least one free-tier LLM key (Gemini, Groq, Cerebras, OpenRouter, or SwiftRouter all work), then start the dev server:

```
npm install
cp .env.example .env.local # add at least one provider key
npm run dev                # http://localhost:3000
```

Full setup and architecture notes live in the project's README.

Following a research run, step by step

1

Name a company

The landing page is just a search bar. Type any company, public or private, well-known or obscure, and hit **Investigate** (or press Enter). If you're not sure what to try, the suggestion chips below the search bar, or the **Surprise me** button, will pick one for you.

The landing screen. Six analysts, one verdict, no login required.

Watch the investigation happen

This is the Research Theater. On the left, a phase rail tracks progress through Identify, Frame, Investigate, Debate, Stress-test and Decide. In the middle, you see the analysts narrate their own work in real time, plus the actual sources they pull up. On the right, a dossier fills in with facts and the open questions the team is still chasing down.

Mid-investigation: the analyst team is fanned out across four workstreams (business & moat, financials, market, catalysts), citing live sources as it goes.

3

Let the desks argue it out

Once the evidence is in, InvestIQ splits into a bull desk and a bear desk that argue opposite sides honestly, each rating its own conviction. A risk officer then sizes up three to five things that could go wrong, by how bad and how likely. Only after that does a CIO agent weigh everything and write the memo, so the verdict isn't just one model's first instinct.

The bull and bear desks building their cases in parallel, right before the CIO steps in to decide.

4

The verdict lands

When the committee is done, you get a short, deliberate reveal: INVEST, PASS, or WATCH. It's a small moment, but it's earned, everything before it was the actual work, not decoration.

SpaceX came back INVEST. WeWork and Beyond Meat, run the same way, came back PASS.

5

Read the memo

The Decision Memo is the part meant to be shared or acted on. It's built to read like something a real investment committee would hand you, not a chat transcript.

The full memo for SpaceX: verdict, conviction, thesis, factor scores and committee balance in one screen.

Making sense of the report

Every memo uses the same handful of terms. Here's what each one is actually measuring.

Decision

INVEST, PASS, or WATCH. The headline call, and the only part that's a single word.

Conviction

0 to 100. How strongly the committee stands behind the call, not how good the company is. A confident PASS still scores high.

Horizon

The rough time frame the thesis is built for, since a good near-term trade and a good long-term hold aren't judged the same way.

Committee balance

The bull desk's score against the bear desk's, side by side. When they're close, the decision was genuinely contested.

Factor scores

Growth, Profitability, Moat, Valuation, Momentum and Management, each scored on its own, so you can see exactly where the case is strong or thin.

Risk matrix

Three to five concrete risks plotted by severity and likelihood, with what would actually offset each one.

Evidence & sources

The findings and links the analysts actually pulled up during Investigate, not a generic citation list added after the fact.

What would change our mind

The specific developments that would flip the call, the same question a real analyst should be able to answer.

Why the verdict isn't always what you'd expect: left alone, most language models rate almost every famous company a buy. InvestIQ's CIO is explicitly told that a great company and a great investment aren't the same thing, and is fed the debate's own numbers before deciding, so an INVEST that contradicts its own committee gets pulled back to WATCH automatically.

A few things worth knowing

- **Outputs vary run to run.** Ask about the same company twice and you may get a different conviction score, or occasionally a different call. That's the debate genuinely landing differently, not a bug, closely contested companies like NVIDIA show this the most.
 - **Be specific with the company name** if it's ambiguous (ticker, full legal name, or a short qualifier like "the aerospace company") so the Identify step locks onto the right entity before analysts start working.
 - **A run takes one to three minutes.** There's no shortcut demo mode. The Research Theater is meant to make that wait worth watching rather than something to skip past.
 - **It reads better with web search on.** Without a search key, the analysts work from what the model already knows. With one, they pull and cite live sources, which is most of what makes the evidence trail worth reading.
 - **Treat it as research, not advice.** It's a structured second opinion built to argue with itself before answering, not a signal to trade on.
-

InvestIQ produces AI-generated research for educational purposes, not investment advice.
